## JH Chapter 4

### 4.3.2.3

(a) One subgraph can be as follows:

(b) 2-APPROX-MIN-VCP( $G$ )  
1 Let  $V'$  be a new empty set of vertexes  
2 **for** each edge  $(u, v) \in G.E$   
3     **if**  $u \notin V'$  and  $v \notin V'$   
4          $V' = V' \cup \{u, v\}$   
5 **return**  $V'$

VCP-SCP.

Lemma.. 4.3.2.12.

(b)  $G_n$  can be a matching with  $2n$  vertexes, as is shown below

共有  $2n+1$  个节点的完全图.

### 4.3.2.6

Algorithm 4.3.2.1 will always computes an optimal vertex cover for the infinite family of stars starting from  $K_2, n$ , i.e.,  $K_n$ ,  $n = 3, 4, \dots$

(归纳法证明).

### 4.3.2.9

(a) TREE-MIN-VCP( $r$ )  
1 **if**  $r == \text{NULL}$   
2     **return** 0  
3 **if**  $r \rightarrow \text{left} == \text{NULL}$  and  $r \rightarrow \text{right} == \text{NULL}$   
4     **return** 0  
5  $\text{size\_incl} = 0$   
6 **if**  $r \rightarrow \text{left}$   
7      $\text{size\_incl} = 1 + \text{MIN-VCP}(r \rightarrow \text{left} \rightarrow \text{left}) + \text{MIN-VCP}(r \rightarrow \text{left} \rightarrow \text{right})$   
8 **if**  $r \rightarrow \text{right}$   
9      $\text{size\_excl} = 1 + \text{MIN-VCP}(r \rightarrow \text{right} \rightarrow \text{left}) + \text{MIN-VCP}(r \rightarrow \text{right} \rightarrow \text{right})$   
10 **return**  $\min(\text{size\_incl}, \text{size\_excl})$

从叶开始加入父, 去掉和父结点相连的节点.

Repeats. until.
